

SEO AUDIT REPORT OF CERTIFYNXT

This project focuses on conducting a complete website audit to identify technical, SEO, content, and user experience issues. The audit helps understand the current performance of the website and provides actionable recommendations for improving its search visibility, usability, and overall digital presence.

1. Website Selection

For this website audit project, I selected **CertifyNXT (certifynxt.com)** as the website to analyze. The audit will focus on evaluating its SEO performance, website structure, content, technical aspects, and overall user experience to identify areas for improvement.

2. SEO Audit Using SEO Optimizer

After selecting CertifyNXT, I used **SEO Optimizer** to perform an SEO audit of the website. The tool analyzed different SEO factors, including on-page optimization, technical SEO, backlinks, social signals, and other website elements. The initial audit generated an overall **SEO grade of C**, which indicates that there are several areas that can be improved.

3. SEO Audit Results

The audit showed that **26 out of 42 checks were passing**, giving the website an overall health grade of **C**. The main areas reviewed were on-page SEO, AI search readiness, links, usability, and performance. On-page SEO scored **12/20**, while links scored **1/4**, indicating a need for improvement in SEO optimization and link quality. Usability and performance both scored **5/7**, while AI search readiness performed better at **3/4**.

4. Key Issues Identified

The audit highlighted two major issues that require immediate attention. First, the homepage contains a **noindex tag**, which prevents search engines from indexing the page in search results. Second, the website has a **weak backlink profile**, with many backlinks coming from low-quality or unrelated domains. These issues can negatively affect the website’s organic visibility and overall SEO performance.

Two things to fix this week

Everything else on this page is an improvement. These two are losses — they actively cost the site traffic right now.

The homepage is telling Google not to index it

A `noindex` tag was found on the page. This instructs search engines to drop it from results entirely, so no amount of content or link work can rank it while the tag is live.

Most likely left over from the staging or development build. Remove the tag, then request re-indexing in Google Search Console.

The backlink profile looks like spam, not authority

381 backlinks come from only 38 domains, and the strongest ones are automated directory and "domain report" pages on throwaway TLDs — `.cfid`, `.sbs`, `.party`, `.fyi` — plus a cryptocurrency mixing site.

30 of 38 referring domains are in Finland and France, with none from Indian education or tech media. Disavow the worst offenders and start earning real links.

5. On-Page SEO Analysis

The on-page SEO audit found that the website has a few important optimization gaps. The homepage has a **short 17-character title tag**, approximately **350 words of content**, and an **inconsistent heading structure**. These issues can make it harder for search engines to understand the page and may limit its SEO potential.

On-page SEO

The technical plumbing is in good shape. What's missing is depth — the homepage is thin, the title is short, and target keywords aren't carried through the headings.

Title tag is using a third of its space

"Home | CertifyNXT" is 17 characters. Search engines show roughly 50–60.

Homepage content is thin

350 words. Search engines treat pages this short as thin content, and LLMs have little to quote.

Heading structure skips levels

Four skipped levels found. H1 → H2 → H3 should descend in order so crawlers can follow the outline.

6. AI Search Readiness

The audit showed that CertifyNXT has strong **AI search readiness**, with major AI crawlers allowed to access the website and the organization schema properly identifying the brand. The content is also readable without heavy JavaScript rendering. However, the website does not have an **llms.txt** file, which could be added to provide AI systems with a clear summary of the website and its offerings.

AI search readiness

The strongest area of the audit. ChatGPT, Perplexity and Google's AI answers can crawl and understand the site — one small file is all that's missing.

- ✓ Major AI crawlers allowed in robots.txt
GPTBot, ClaudeBot, PerplexityBot can all reach the site
- ✓ Organization schema identifies the brand as an entity
- ✓ Content readable without heavy JavaScript rendering
- ✗ No llms.txt file
A plain-text summary of what the site offers, for AI engines

Why this matters for an EdTech brand

Course discovery is increasingly starting inside AI assistants — "best Python course with certificate in India" is now an AI answer as often as a search page. CertifyNXT is technically eligible to appear in those answers. Thin homepage content is the main thing limiting how much an AI engine can say about it, which ties this back to the content fix on the previous section.

7. Link Analysis

The link audit identified backlinks as one of the weakest areas of the website. CertifyNXT has **381 backlinks from 38 referring domains**, with **334 dofollow** and **47 nofollow** links. However, the audit found **0 .edu/.gov links** and several backlinks from unrelated or low-authority domains. Building relevant, trustworthy backlinks from education and technology websites can help strengthen the website's link profile.

8. Speed and Performance Analysis

The audit found some performance issues that may affect the website's loading speed. The server response time is **1.87 seconds**, while the total page size is **3.07 MB**, with images accounting for **2.72 MB**. Compressing images, using modern formats such as WebP, enabling lazy loading, and improving caching can help reduce page weight and improve loading performance.

9. Usability, Social and Email Analysis

The audit found that the website has a **responsive layout** and several social platforms are properly connected. However, some improvements are needed, including the poor desktop PageSpeed score, disabled zoom accessibility, missing YouTube and X profiles, and the absence of Facebook Pixel. The website also lacks **SPF, DMARC, and LocalBusiness schema**, which should be addressed to improve email security, tracking, and local SEO

10. Fix Plan and Recommendations

Based on the audit findings, a total of **20 recommendations** were identified across different areas of the website. The recommendations mainly focus on **on-page SEO, website setup, link building, performance, usability, and AI search readiness**. The fixes are categorized by priority to help address the most important issues first and gradually improve the website's overall SEO health.

Usability, social and email setup

Mobile rendering is sound. The gaps are in measurement and in channels that aren't connected yet.

Device experience

- ✓ Responsive viewport set correctly
- ✓ Favicon present
- ✓ No Flash or iframes
- ✓ No email addresses exposed in plain text
- ! Desktop PageSpeed score is poor
- ! Zoom is disabled in the viewport tag
user-scalable=no hurts accessibility

Social presence

- ✓ Facebook page linked
- ✓ Instagram linked
- ✓ LinkedIn company page linked
- ✓ Open Graph and X card tags present
- ✗ No YouTube channel
The obvious gap for a course platform
- ✗ No X profile linked
- ✗ No Facebook Pixel — retargeting isn't possible

Email and local

- ✗ No SPF record
Course enrolment emails risk landing in spam
- ✗ No DMARC record
Leaves the domain open to spoofing
- ✗ No LocalBusiness schema
- ✓ HTTP/2, HSTS and nginx configured
- ✓ No deprecated HTML tags
- ! Inline styles found — move to stylesheets

10. Fix Plan and Recommendations

Based on the audit findings, a total of **20 recommendations** were identified across different areas of the website. The recommendations mainly focus on **on-page SEO, website setup, link building, performance, usability, and AI search readiness**. The fixes are categorized by priority to help address the most important issues first and gradually improve the website's overall SEO health.

The fix plan

All 20 recommendations, grouped by when to do them. Priorities are taken from the audit; sequencing is ours.

Recommendations by area

Where the work sits.

Priority mix

20 recommendations in total.

Conclusion

The website audit of CertifyNXT identified several areas that require improvement, particularly in **technical SEO, on-page optimization, backlinks, website performance, and usability**. The audit also showed positive aspects, such as good AI search readiness and a responsive website structure. By implementing the recommended fixes, improving content, optimizing images, resolving indexing issues, and building relevant backlinks, CertifyNXT can strengthen its SEO foundation and improve its overall online visibility and user experience.
